NFL Analytics:
Measuring The Blazin’ 5 Effect

Josiah Connors

Duke AIPI 510: Sourcing Data for Analytics

10/3/2026

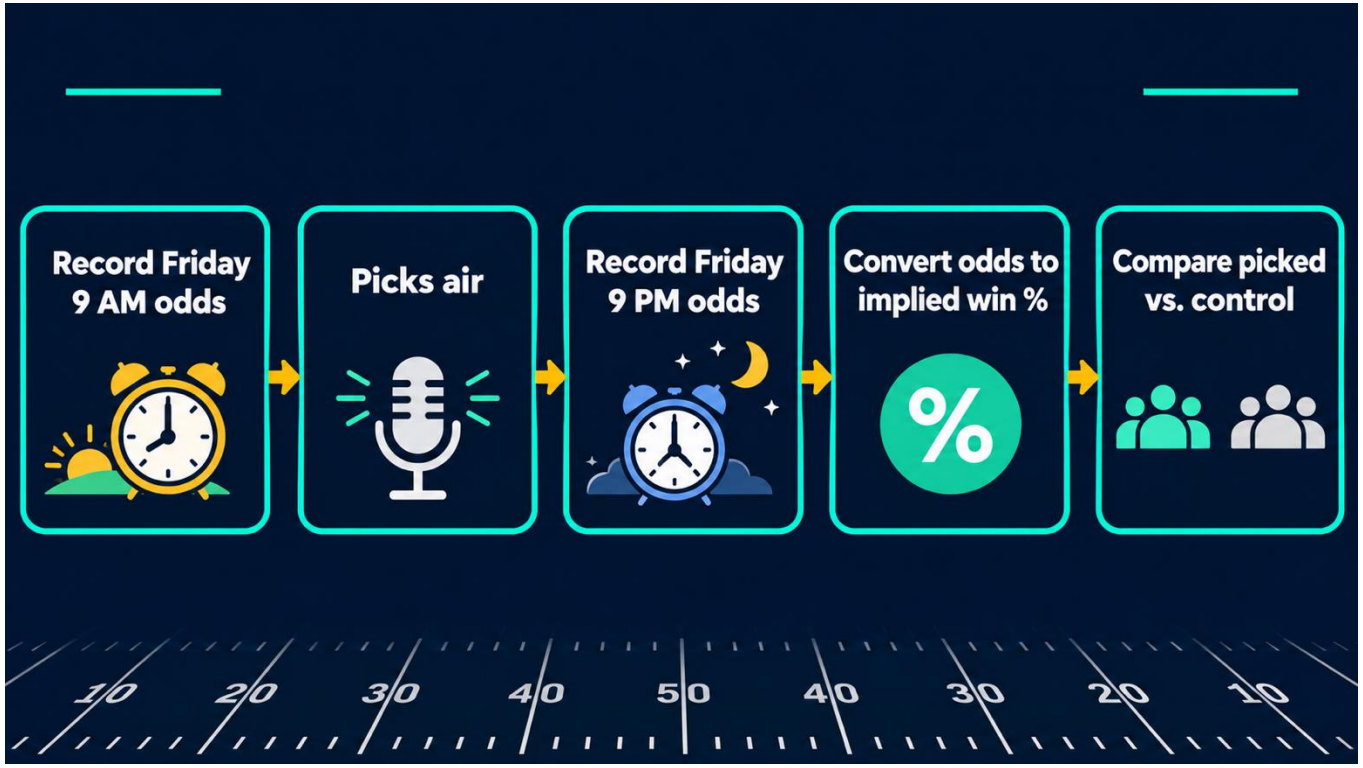

Research Question

- Question: do the Blazin' 5 endorsement games shift differently in implied win probability than non endorsed games?
- Null (H_0): the picked games and the control games have the same average change in implied win probability over the day. The *Blazin' 5* leaves no measurable mark
  Alternative (H_1): the picked games and the control games have a different average change in implied win probability

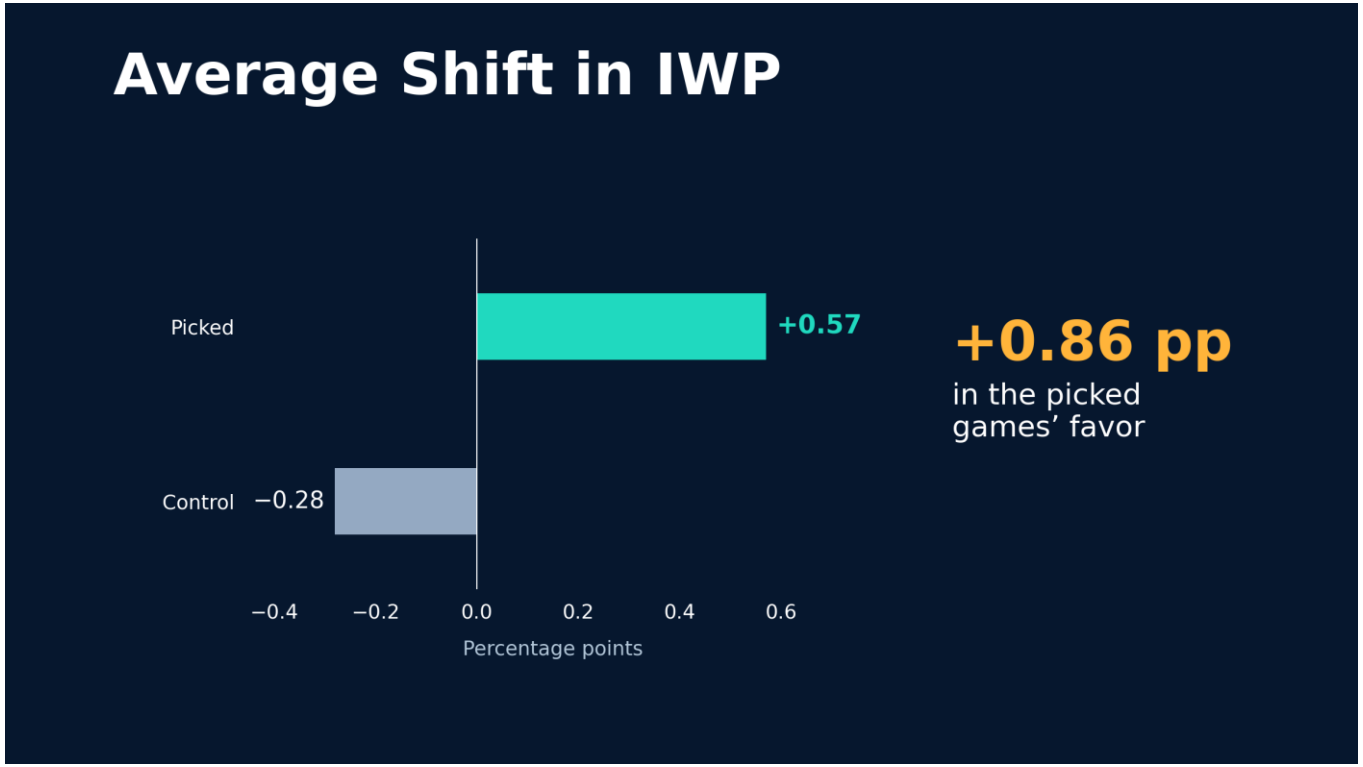

Experiment Design

- Pilot experiment using week 7 NFL slate: 13 games: 5 picked, 8 control
- Quasi-experimental: Cowherd chooses the picks, no randomization, only association measured
- DraftKings Sportsbook Odds recorded Friday, October 23rd at 9am & 9pm
- Moneylines converted to implied win percentages; percentages compared to demonstrate probability shifts

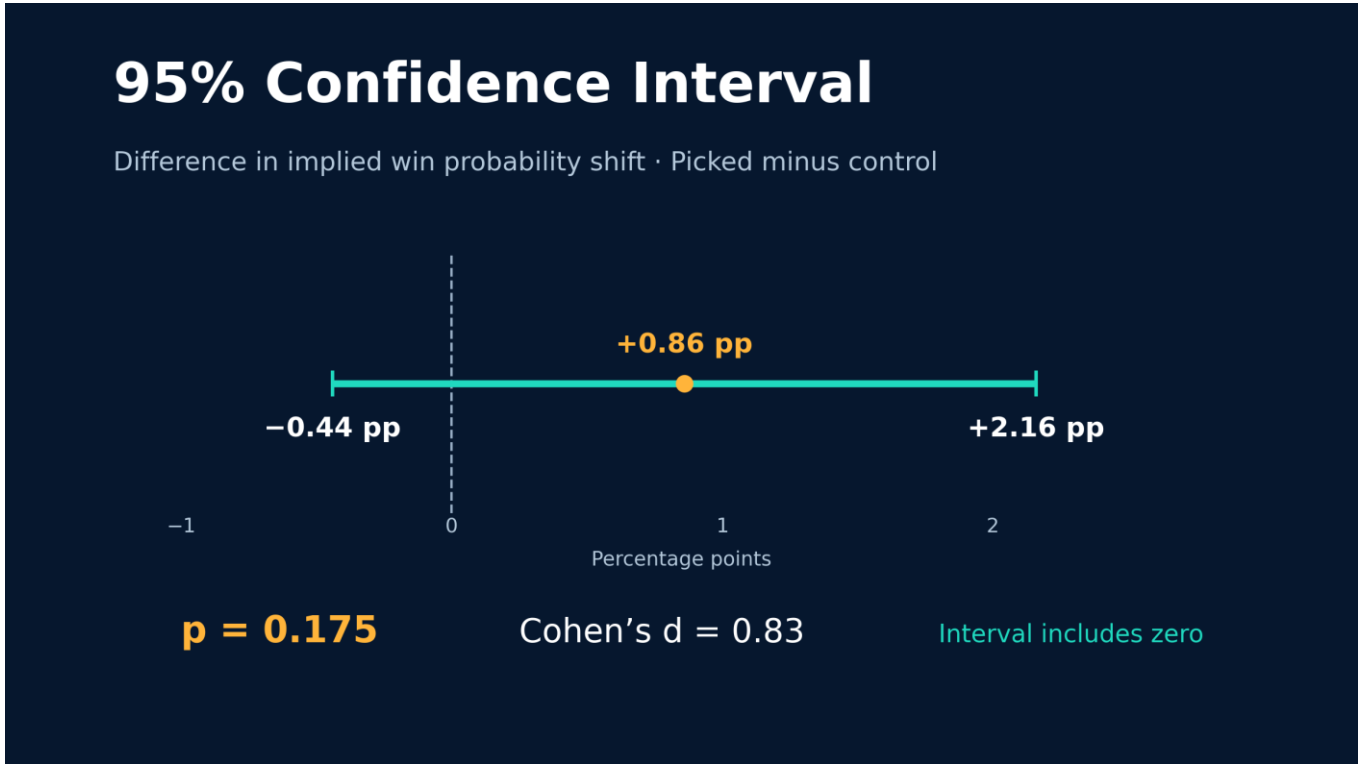

Experiment Results

- Endorsed teams rose by 0.57 percentage points throughout the day, while control games shifted down by 0.28 percentage points
- 0.86 percentage point difference between endorsed teams and control teams

Statistical Significance

- Not statistically significant, p = 0.175, cannot rule out the gap being attributed to chance
- 95% CI includes zero
- 0.86 percentage points is an observed difference, but may not matter in practice

Experiment Limitations

- Small Sample Size (13 vs 128 required)
- One Sportsbook
- Confounding variables

Key Takeaways

- Signals a direction worth a larger study, but no confirmed effect
- Demonstrates significance of power analysis & statistical pilots
- Cautions against poor experiment design
